RESULT
                                                  The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
c aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
practical kits for courses related to genetics and molecular biology,
protein chemistry and antibody production and analysis. The
polymucleotide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
proteins by western blotting, protein purification, determining the
weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
sequencing. The present sequence is Sistrurus miliarius venom gland
protein, Zsnk2 gene.

The anti-thrombosis enzyme was administered to rabbits intravencusly. Thrombosis enzyme was an atter the administration at 0.5, 1.0, 2.0 and 3.0 hours by the Chandler method. The enzyme showed anti-thrombosis activity at 0.5 hour following administration at 0.05 microlyfs and this activity was increased significantly at 1.0 hour and at 0.01 micro /kg. The composition is useful for preventing and treating vaso-occulusive and thromboembolic disorders, including myocardial infarction, restenosis,
cDNA encoding Deinagkistrodon acutus antithrombosis enzyme beta chain.
                                                                                                                                                                                                                                                                                                                      peripheral arterial occulsion; stroke; atherosclerosis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New purified Agkistrodon actus anti-thrombosis enzyme, useful for preventing and treating vaso-occulusive and thromboembolic disorders, including myocardial infarction, restenosis, cerebral thrombosis and

The protein was separated from snake venom of Agristrodon halys brevicaudus (a Korean pit viper) and can be used in the treatment of thrombogenesis. The present sequence

The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The

```

```
The invention relates to new pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet aggregation system. The polypeptides, which affect blood coagulation and
polynucleotide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tags, mass spectrometry, circular dichroism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. The present sequence is Sistrurus miliarius venom gland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Jmy rattlesnake (Sistrurus miliarius) venom gland proteins, which blood coagulation and platelet aggregation system, useful in , and diagnostics, or as tools in the study of genetics or

platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The polymolectide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal ages, mass spectrometry, circular dichroism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. The present sequence is Sistrurus miliarius venom gland

The invention comprises the nucleotide and protein sequences of a salmorin protein derived from the venom of Korean adder. Salmorin protein is composed of an A chain and a B chain, and has inhibitory activity against fibrinogen clotting. The salmorin protein of the invention is useful for treating thrombosis, as it represses fibrinogen clotting potently by binding to prothrombin and thrombin so as to delay blood cogquiation. The present cDNA sequence encodes the Korean adder salmorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 AspCysSerSerAspTrpSerSerTyrGluG1yHisCysTyrLysValPheLysGlnSer 20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       which
                                                The invention relates to halyxin, a novel protein with very strong blood anticoagulation activity. The protein was separated from snake venom of Agkistrodon halys brevicaudus (a Korean pit viper) and can be used in the treatment of thrombogenesis. The present sequence encodes the A chain of halyxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pigmy rattlesnake venom gland protein Zsnk3, degenerate nucleic acid.
Halyxin as blood anticoagulation protein separated from snake venom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to new pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet

                            platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The polymelectide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal agis, mass spectrometry, circular dichrism to determinal conformation or sequencing. The present sequence is Sistrurus miliarius venom gland

The invention relates to a new Deinagkistrodon actus anti-thrombosis enzyme, where the enzyme hydrolyses fibrin, dissolves blood clots and prevents platelet aggregation. The anti-thrombosis was arsyme was administered to rabbits intravenously. Thrombosis was determined before and after the administration at 0.5, 1.0, 2.0 and 3.0 hours by the Chandler method. The enzyme showed anti-thrombosis activity at 0.5 hour collaborated administration at 0.05 micro/kg and this activity was increased significantly at 1.0 hour and at 0.01 micro /kg. The composition is useful for preventing and treating vaso-occulusive and thrombosito, thrombosis, crebral thrombosis, ischaemic cerebral vascular diseases, unstable angina, acute thrombosis, ischaemic cerebral vascular diseases, unstable angina, acute thrombosis, unstable stenocardia, thrombosis, atterial acculsion, stroke. It is also useful for treating atherosclerosis, oedema and inflammation, cancer and neurodegenerative diseases. The present sequence represents cDNA encoding the Deinagkistrodon acutus antithrombosis enzyme alpha chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

This invention relates to a method for the production of a subunit peptide originating from a polymer protein with disulphide bonds within and between subunits. The method comprises denaturing the protein or its subunit using a protein denaturing the subunit using a protein denaturing agent in a solution, removing the agent in the presence of a polyoxyalkyl polyether which reacts with a polyether lowup and unwinds the subunit, and separating the polyoxyalkyl polyether-bound subunit peptide. The method can be used for producing physiologically-active subunit peptides for polymer proteins e.g. snake women-originated dimer peptide with blood platelet-inhibitory activity on von Willebrand's factor. The peptides produced have platelet-binding inhibitory, and thrombolytic activity. The present sequence represents marked at the protein used in an example illustrating the

/product= "Antithrombotic wild-type rattlesnake protein"
 Producing physiologically-active subunit peptides originating in polymer proteins by denaturation and specific separation, with lower antigenicity but improved solubility and stability, e.g. blood platelet-binding inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding the antithrombotic wild-type rattlesnake protein.

                                                                                                                                                                                                The invention relates to a glycoprotein Ib-binding protein, originating from snake venom, comprising specific mutations and antithrombotic activity. Glycoprotein Ib-binding protein is used in a drug having antithrombotic activity. Glycoprotein Ib-binding protein has a high binding activity to glycoprotein Ib, a long half life/drug efficacy retention in blood, and low antigenicity. This polymucleotide sequence represents DNA of the wild-type rattlesnake protein of the invention.
                                                                                                    Glycoprotein Ib-binding protein, useful for treating thrombosis, comprises specific mutations in protein originating from snake venom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pigmy rattlesnake, venom gland protein, blood coagulation, therapy; platelet aggregation; gene; Zsnk4; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /product= "Zsnk4 protein"

The invention relates to new pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet venom gland proteins, which affect blood coagulation and platelet aggregation system. The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful in therapy and diagnostics. The protein chemistry and antibody production and analysis. The protein chemistry and antibody production and analysis. The polymelectide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tass, mass spectromerry, dircular dichroism to determine conformation or sequencing. The present sequence is Sistrurus miliarius venom gland protein, Zsnk4 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pigmy rattlesnake venom gland protein Zsnk4, degenerate nucleic acid.
                                                                                                                                                                                                                                                                                                                                     New pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, wh

Agkistrodon halys brevicaudus

which

```
The invention relates to new pigmy rattlesnake (Sistrurus miliarius)

venom gland proteins, which affect blood coagulation and platelet

dagregation system. The polypeptides, which affect blood coagulation and

platelet aggregation system, are useful in therapy and diagnostics. The

polypeptides are also useful as an educational tool in laboratory

proteins courses related to genetics and molecular biology,

protein chemistry and antibody production and analysis. The

polymucleotide or polypeptide can be used as standards or as unknowns

columnistry and purposes. The polypeptides are also useful in identifying

proteins by western bloctting, protein purification, determining the

weight of expressed polypeptides as a ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal

tags, mass spectrometry, circular dichroism to determine conformation or

affinity chromatography columns to purify the protein, cloning or

sequencing. The present sequence is Sistrurus miliarius venom gland

The invention comprises the nucleotide and protein sequences of a salmorin protein derived from the venom of Korean adder. Salmorin protein is composed of an A chain and a B chain, and has inhibitory activity against fibrinogen clotting. The salmorin protein of the invention is useful for treating thrombosis, as it represses fibrinogen clotting potently by binding to prothrombin and thrombin so as to delay blood cognilation. The present cDNA sequence encodes the Korean adder salmorin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 CysSerSerAspIrpSerSerTyrGluGlyHisCysTyrLysValPheLysGlnSerLys 21
